

Prompt:

I want to generate **individual PDF letters** for each customer from a **Word document**, using **Excel data** as input. I haven't designed the Word document yet, so please **create it dynamically using VBA**. The data is available in an Excel file with headers, and the fields are as follows:

1. **Column B:** Customer Name
2. **Column C:** Email ID
3. **Column D:** Pending Amount
4. **Column E:** Due Date

Requirements:

1. Generate a **single Word document**, where each customer's letter appears on a **separate page**.
2. The letter format should be as follows:

To,

[Customer Name]

Subject: Reminder: Pending Payment for [Product/Service]

Dear [Customer Name],

I hope this email finds you well.

We would like to kindly remind you that a payment of Rs.[Pending Amount] is currently outstanding for the [Product/Service] provided on [Due Date]. We understand that oversights happen, and we appreciate your prompt attention to this matter.

Please arrange for the payment at your earliest convenience. If you have already processed the payment, kindly disregard this notice. Should you require any further details or have any questions, feel free to reach out to us.

****Payment Details:****

Amount Pending: Rs.[Pending Amount]

Due Date: [Due Date]

Thank you for your cooperation.

Best regards,

Skill Course

3. After generating the Word document, the VBA code should:

- Prompt me to choose a folder to **save individual PDF files**.
- Save each page of the Word document as a **separate PDF**, with each PDF **named after the customer** (e.g., Ravi_Sharma.pdf).

Please write a **complete Excel VBA code** that accomplishes all of the above.
